1. Objective

The objective of this project is to analyze transaction data and build an interactive Revenue Analytics Dashboard to monitor business performance.

The dashboard helps identify:

- Total transaction volume
- Gross merchandise value (GMV)
- ERP revenue
- Edviron net and gross revenue
- Payment behavior trends
- Gateway contribution
- Institute-wise revenue performance

This enables better understanding of the revenue pipeline and operational performance.

2. Data Preparation

The raw transaction dataset was first cleaned and structured for analysis.

Key steps included:

- Importing raw data into Excel
- Ensuring numeric columns were correctly formatted
- Creating calculated fields for revenue metrics
- Handling percentage and flat pricing structures
- Removing data inconsistencies

The dataset was organized into the following sheets:

*) Clean_Data

*) Calc_Model

*) Reports

*) Dashboard

Revenue Analytics Dashboard

3. Revenue Calculations

Several calculated fields were created to derive business metrics:

Merchant Pricing (INR)

Converted merchant pricing from percentage or flat format into actual currency values.

Partner Pricing (INR)

Calculated partner share of transaction revenue.

Edviron Buying (INR)

Calculated Edviron's acquisition cost.

ERP Revenue

Computed using:

ERP Revenue = Merchant Pricing − Partner Pricing

Edviron Net Revenue

Revenue retained after accounting for buying costs.

Edviron Gross Revenue

Total gross margin generated by transactions.

4. KPI Metrics

Key performance indicators displayed in the dashboard:

- **Total Transactions**
- **Total GMV**
- **ERP Revenue**
- **Edviron Net Revenue**
- **Edviron Gross Revenue**

These KPIs provide a quick overview of business performance.

5. Dashboard Visualizations

The dashboard includes several analytical charts:

Revenue Trend Chart

Shows how revenue evolves over time.

Gateway Contribution

Displays the percentage share of transactions processed by each payment gateway.

Payment Method Distribution

Illustrates customer payment preferences such as UPI, cards, and net banking.

Revenue Analytics Dashboard

Top Institutes by Revenue

Highlights the institutes generating the highest revenue.

6. Interactive Filters

The dashboard includes slicers for dynamic filtering:

- Gateway
- Payment Method
- Institute Name
- Transaction Status

These filters allow users to interactively analyze specific segments of the data.

7. Conclusion

The dashboard provides a comprehensive view of transaction revenue and operational performance.

Key insights include:

- Dominant payment methods
- Gateway transaction distribution
- Revenue contribution by institutes
- Overall revenue trends

This dashboard can support decision-making and help monitor revenue performance efficiently.
